

## Special Problem 2-4.12

Two points exist in space, denoted as point  $P_a$  and point  $P_b$ .

This is what we know about the location of point  $P_a$ :

1. It is located a distance of 2 units from the z-axis.
2. It lies **on** the y-z plane, in the portion where  $y > 0$ .
3. It is located 2 units **above** the x-y plane.

This is what we know about the location of  $P_b$ :

1. It is located a distance of 4 units from the origin.
2. It has a coordinate value  $\theta = 90^\circ$ .
3. It lies **on** the x-z plane, in the portion where  $x > 0$ .

Determine:

- a) The **position vectors** denoting the locations of point  $P_a$  and  $P_b$
- b) The **directed distance** from point  $P_a$  to point  $P_b$
